INTRODUCTION

At present, we can see that remarkable achievements and scientific innovations have been achieved in any field, while the role of modern Information Technology in this success is incomparable. At the same time, the reproach for obtaining science among the younger generation is growing. In addition to the increased taste for modern knowledge and professions in particular, young people are increasing their scientific potential in developed countries of the world with their interests and desire to acquire new knowledge. In its place, studying in a foreign country also has its own shortcomings and achievement aspects, including these: Studying in another well-developed country like the US, UK, and Japan can have a significant influence on the state of education in the home country. This can include differences in language, food, customs, and social norms. Language barriers: Language barriers can be a significant challenge for students who are not fluent in the language spoken in the host country. This can make it difficult to communicate and participate in classes and daily life. Homesickness: Being away from family and friends can be difficult, especially for students who have never been away from home before. Financial challenges: Studying abroad can be expensive, and students may have to take on debt or work to support themselves while they study. Adjusting to a new academic system: Studying abroad may require students to adjust to a new academic system, curriculum, and teaching style, which can be difficult. Building a support network: International students may need to build a support network from scratch, including making new friends, finding mentors, and seeking out resources for support. Travel opportunities: Studying abroad can provide students with the opportunity to travel and explore a new country or region, which can be a significant benefit for many students.

DISCUSSION AND RESULT

According to the UNESCO Institute for Statistics, in 2019, there were 5.3 million international students enrolled in tertiary education programs around the world, which is a 78% increase from 2000. Here are some specific statistics about studying abroad around the world.
